SUBJECT: Toxicological Review of HW26 Data 2 April 2012
Dimock, PA

FROM: Dawn A. Ioven, toxicologist
Technical Support Branch (3HS41)

TO: Rich Fetzer, OSC
Eastern Response Branch (3HS31)

On 31 January 2012, U.S. EPA collected water samples from HW26 in Dimock. The samples were analyzed for over 200 constituents, including volatile organic compounds, semi-volatile compounds, metals and bacteria. The analytical results were then validated and compared to risk-based screening levels and/or standards for public drinking water supplies.

Methane

In HW26, methane was detected at 43,000 ug/L (wellhead) and 38,000 ug/L (kitchen sink). A quantitative assessment of risk cannot be performed for methane, nor does U.S. EPA have a drinking water standard for this compound. However, the Department of Interior (Office of Surface Mining Reclamation and Enforcement) has established a Recommended Action Level of 28,000 ug/L for dissolved methane in drinking water. This value is based on the potential threat of explosion associated with methane in confined environments. The potential for methane in air to create an explosive environment depends on a number of factors, such as the concentration, the volume of the space and the frequency of air exchanges in the space. Proper room ventilation will ensure that methane levels in indoor air do not present a safety hazard.

Sodium

Samples collected from HW26 contained sodium at a concentration of 27,400 ug/L (wellhead, wellhead filtered, and kitchen sink). A quantitative assessment of risk cannot be performed for sodium; however, U.S. EPA has a non-enforceable Health Advisory of 20,000 ug/L for sodium in drinking water. This value is based on recommendations for individuals on sodium-restricted diets.

No other constituents were detected at levels of concern in this well.
